

Kings, Fresno and Tulare Small Grain Variety Performance Trials

*Steve Wright, Jorge Dubcovsky, Lee Jackson, Lalo Banuelos, Phil Mayo, Diane Prato,
Kelly Hutmacher, Sonia Rios, Kerista Hernandez, Travis Avila*

Small grain variety tests were conducted at multiple locations throughout California, coordinated by Wheat Breeder Jorge Dubcovsky. The results from Kings, Tulare, and Fresno Counties small plot trials are shown on the following pages. The regional wheat, barley and triticale trials in Kings County were conducted near Corcoran and at the Westside Research and Extension Center in Five Points. The Tulare site was rain fed, but received 100 pounds of Nitrogen. Special thanks to Boyett Farms, Changala Farms, Milky Way Dairy, and WSREC for their cooperation in these studies. An Agronomy Progress Report containing more detailed results from all trials is available at: <http://smallgrains.ucdavis.edu> and <http://cetulare.ucdavis.edu>.

The 2011 cool weather delayed crop development and wheat harvest by about 10 days. Weather conditions were ideal for wheat stripe rust. Stripe rust did occur in fields with a few susceptible wheat varieties and several triticale varieties.

Wheat varieties have different levels of genetic resistance to stripe rust, and as several new races of rust develop, the resistance breaks down. Often, our best silage varieties are also the high yielding grain varieties with high protein, resistance to disease and resistance to lodging and early maturing. A dual purpose variety gives options, particularly when grain prices are high and silage prices low or vice versa, or when water may be limited. Choose more than one variety or grain type to reduce the impacts of weather, disease, harvest schedules, and economics.

- First and foremost, select and plant varieties with good resistance along with high yield potential.
- Second, a well-timed fungicide application was shown to reduce the yield loss even in resistant varieties when weather conditions favor the disease. Stripe Rust resistance based on observations from the University of California statewide variety tests indicate:

Susceptible: Yecora Rojo, Mika, Blanca Grande, WB-Paloma, Joaquin, Pacheco-(T)

Moderately Susceptible: Kronos-(D), Duraking-D, Topper- (D), Clear White, Triple IV-(BW)

Moderately resistant: PR 1404-(BW), Redwing, Ultra, WB-Cristallo, Westmore- D, Crown-D, Platinum-(D) , Trical 118 (T), Camelot-(T),

Resistant: Cal Rojo, Espresso, Blanca Royale, Blanca Fuerte, Blanca Grande 515, Summit 515, Lariat, Lassik, Patwin, WB-Rockland, Fortissimo- (D), Volante-(D), Desert King- (D), Trical 115-(T)

D=Durums, T= Triticale, BR= beardless wheat The remainder are common wheats.

2011 California Wheat Variety Survey California Wheat Commission

Overall estimated wheat plantings for the 2011 harvest season were up ~14% from last year's plantings, for a total of ~750,000 acres. Statewide, Durum acreage showed the largest percentage increase (nearly 30%) while Hard Red wheat plantings were up ~13%. Hard White acreage was down 10%, mostly due to less white wheat in the Sacramento Valley region. Soft white wheat in far Northern California is estimated up substantially from last year's below-normal plantings.

CALIFORNIA'S RED AND WHITE WHEATS:

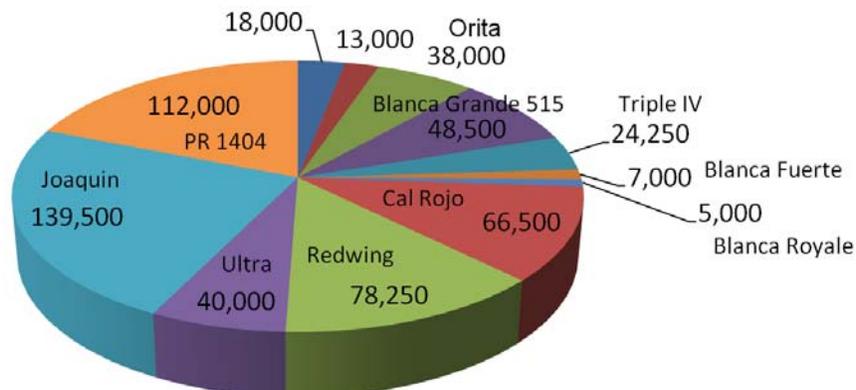

Combined red and white wheat in California accounted for 86% of all wheat acreage planted, with red wheat alone accounting for 70% of the varieties planted. Growers in both the San Joaquin and Sacramento Valleys planted more Hard Red wheat this year. Joaquin and the hay/forage variety PR1404 topped the list of red acreage planted in the San Joaquin Valley, whereas the varieties Redwing, PR1404 and Cal Rojo had the most acreage in the Sacramento Valley. Hard White acreage in the San Joaquin Valley was unchanged from last year; most of this acreage shifted to Blanca Grande 515. And although total overall acreage in the Sacramento Valley was up, growers planted less Hard White wheat in this region. Spring wheat planting is just getting started in far Northern California, but estimates are that plantings will increase substantially from last year's lower levels.

DURUM:

The nearly 30% increase in Durum acreage this year was a result of increased Desert Durum® plantings in southern California. Orita, Desert King, and Havasu continue to be the top varieties planted in that region. The Durum planted in the San Joaquin Valley was dominated by the variety Platinum for the second year in a row. Durum acreage in the San Joaquin Valley was down slightly from last year.

CA Wheat Estimates - 2011

Small Grain Silage Variety Trial 2011 - Tulare County

S. Wright, L. Banuelos, N. Silva del Rio, C. Collar, Kerista Hernandez, Hailey Stambach

The study was conducted in Tulare County, planted on November 12, 2010 with a Krause 20 foot at a seed rate of 120 pounds per acre. The soil temperature was 54°F, and the outside temperature was 60°F. The harvested plot sizes were 18 feet by 1,230 feet with four replications, and were harvested on May 23, 2011 by a CLAAS Jaguar w/ Disc 520 Contour with a wind factor of 0-2 miles per hour. All varieties were double cut to account for the lodging that occurred. Under the conditions of this study the triticales yielded highest and had the highest TDN. There is no statistical difference between treatments followed by the same letter. Lodging was a significant problem that affected yields even though the varieties were double cut.

| Variety | Type | Harvest % H ₂ O | Tons/Acre 70% H ₂ O | Height (in) | Lodging % | TDN | Protein (DM %) | ADF (DM %) | NDF (DM %) | Ash (DM %) |
